# FLUID COOLING | Industrial AOVH Series

### **FEATURES**

- High Performance AO
- High Flow Rates
- Compact
- One or Two Pass
- Fluid Power Systems
- Gear Drives
- Injection Molding Machines
- Machine Tools
- Torque Converters
- Hydraulic Presses

#### **OPTIONS**

Internal SAE Straight Threads SAE & Metric Connections

Relief Bypass

**Corrosive Resistant** Marine Coating

### Ratings

Operating Pressure - 300 psi **Operating Temperature - 400° F** 

### **Materials**

**Tubes** Copper

Fins Aluminum

**Turbulators** Steel

Fan Blade Aluminum with steel hub

Fan Guard Zinc plated steel

Cabinet Steel with baked enamel finish

Manifolds Steel

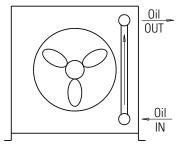

**Connections** Steel

Weights	
MODEL	Net Weight (LBS)
AOVHR - 5	67
AOVHR - 10	78
AOVHR - 15	90
AOVHR - 20	110
AOVHR - 25	157
AOVHR - 30	190
AOVHR - 35	315
AOVHR - 40	350

### Two Pass Only (Low to Medium Oil Flows)

<b>Model Number</b>	Flow Range GPM (USA)
A0VHR - 5-2	4 - 50
A0VHR - 10-2	4 - 60
AOVHR - 15-2	4 - 60
A0VHR - 20-2	4 - 80
A0VHR - 25-2	4 - 80
A0VHR - 30-2	4 - 80
A0VHR - 35-2	6 - 80
A0VHR - 40-2	8 - 80

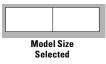

#### **AOVHR Series**

### How to Order

Bypass

2 - Two Pass Only

M - Metric

**Relief Bypass** Setting\* **30**-30 psi 60 - 60 psi

Specify Motor Required Single Phase Single Phase Expl. Proof

Three Phase Three Phase 575 Volt Three Phase Expl. Proof

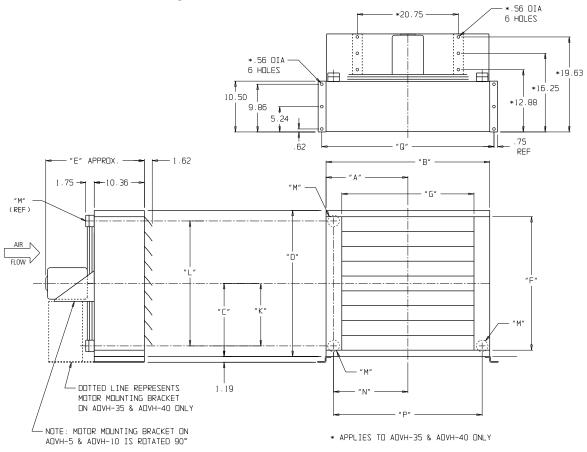

<sup>\*</sup>ADD FOR AOVHR MODELS ONLY: Relief Bypass Setting & Number of Passes

NOTE: All dimensions in inches.

### Fan Rotation Clockwise/Facing Motor Shaft

### **Installation Piping Diagram**

<sup>\*</sup>See dimension chart for NPT or optional internal SAE connection size.

#### **Lubrication Notes**

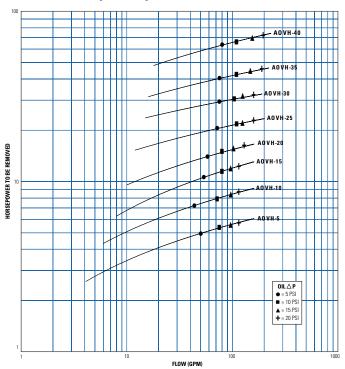

Caution: Do not over oil or over grease.

**Ball bearings** – No grease needed at start up. Grease as follows:

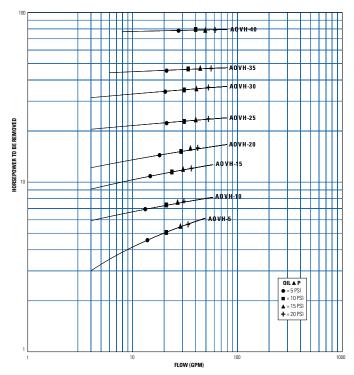

5,000 Hours/Year	5 Year Grease Interval
Continuous Normal Applications	2 Years
Seasonal Service Motor is idle for 6 months or more	1 Year
Continuous High ambients, dirty or moist locations, high vibration	6 Months

## **Performance Curves**

### One Pass Oil (AOVH)

### Two Pass Oil (AOVH or AOVHR)

# **Selection Procedure**

Performance Curves are based on 50SSU oil leaving the cooler  $40^{\circ}$ F higher than the ambient air temperature used for cooling. This is also referred to as a  $40^{\circ}$ F approach temperature.

**STEP 1 Determine the Heat Load.**This will vary with different systems, but typically coolers are sized to remove 25 to 50% of the input nameplate horsepower.

(Example: 100 HP Power Unit x .33 = 33 HP Heat load.)

If BTU/Hr. is known: HP =  $\frac{BTU/Hr}{2545}$ 

**STEP 2 Determine Approach Temperature.** Desired oil leaving cooler °F — Ambient air temp. °F = Actual Approach

**STEP3 Determine Curve Horsepower Heat Load.** Enter the information from above:

Horsepower heat load x  $\frac{40 \text{ x Cv}}{\text{Actual Approach}}$  = Curve Horsepower

**STEP 4 Enter curves** at oil flow through cooler and curve horsepower. Any curve above the intersecting point will work.

**STEP 5 Determine Oil Pressure Drop from Curves:**■ = 5 PSI: ■ = 10 PSI: ▲ = 15 PSI: ★ = 20 PSI.

● = 5 PSI; ■ = 10 PSI;  $\blacktriangle$  = 15 PSI;  $\dotplus$  = 20 PSI. Multiply pressure drop from curve by correction factor found in oil  $\triangle$  P correction curve.

### **Desired Reservoir Temperature**

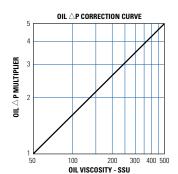

**Return Line Cooling:** Desired temperature is the oil temperature leaving the cooler. This will be the same temperature that will be found in the reservoir.

**Off-Line Recirculation Cooling Loop:** Desired temperature is the oil temperature entering the cooler. In this case, the oil temperature change must be determined so that the actual oil leaving temperature can be found. Calculate the oil temperature change (oil  $\triangle$  T) with this formula: Oil  $\triangle$  T = (BTU's/Hr.) / (GPM Oil Flow x 210).

To calculate the oil leaving temperature from the cooler, use this formula: Oil Leaving Temp. = Oil Entering Temp — Oil  $\triangle$  T.

This formula may also be used in any application where the only temperature available is the entering oil temperature.

**Oil Pressure Drop:** Most systems can tolerate a pressure drop through the heat exchanger of 20 to 30 PSI. Excessive pressure drop should be avoided. Care should be taken to limit pressure drop to 5 PSI or less for case drain applications where high back pressure may damage the pump shaft seals.

### Oil Temperature

Typical operating temperature ranges are:

Hydraulic Motor Oil 110° - 130°F Hydrostatic Drive Oil 130° - 180°F Bearing Lube Oil 120° - 160°F Lube Oil Circuits 110° - 130°F

### C<sub>V</sub> Viscosity Correction

		OIL										
	SAE 5	SAE 10	SAE 20	SAE 30	SAE 40	50-50						
Average	110 SSU at 100°F	150 SSU at 100°F	275 SSU at 100°F	500 SSU at 100°F	750 SSU at 100°F	Ethylene Glycol
